Paths Regions as Boxes Universes as Boxes Motivation The Problem The Solution

Race Conditions

Race conditions:

- > are bugs in shared memory concurrent software.
- are caused by incorrect synchronisation.
- are hard to reproduce.
- can corrupt program state.
- can lead to strange program behaviour.

Testing hard... \implies Static type system?

Paths Regions as Boxes Universes as Boxes Motivation The Problem The Solution

Race Conditions

Race conditions:

- ▶ are bugs in shared memory concurrent software.
- are caused by incorrect synchronisation.
- are hard to reproduce.
- can corrupt program state.
- can lead to strange program behaviour.

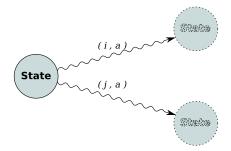

Testing hard... \implies Static type system?

Can prove it correct...

Motivation The Problem The Solution

Instantaneous Race Condition

A state where two threads can access the same object:

We prove such states never arise during execution.

≣ >

Paths Regions as Boxes Universes as Boxes Motivation The Problem The Solution

Object Accesses and Locks

If we know that:

- ▶ No two threads simultaneously hold the same lock.
- Threads only access objects for which they hold the lock.

Then: Threads will never simultaneously access an object.

Paths Regions as Boxes Universes as Boxes Motivation The Problem The Solution

General Approach

Enforcing synchronisation is the key:

```
sync (e') {
    ...
    e.f = 10;
    ...
}
```

æ

・ロン ・団 と ・ 国 と ・ 国 と

Motivation The Problem The Solution

General Approach

Enforcing synchronisation is the key:

```
sync (e') {
    ...
    e.f = 10;
    ...
}
```

Require that e' is guarded by the same lock l:

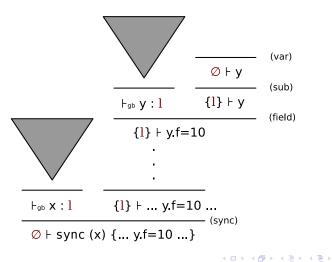

⊢_{gb} e':l ⊢_{gb} e:l

æ

<ロ> (日) (日) (日) (日) (日)

Paths Regions as Boxes Universes as Boxes Motivation The Problem The Solution

Example

æ

Motivation The Problem The Solution

Type System (for illustrative purposes only!)

$$\begin{array}{c}
\mathbb{L} \vdash e \\
\stackrel{\leftarrow}{}_{gb} e : 1 \\
1 \in \mathbb{L} \\
\mathbb{L} \vdash e.f
\end{array} (Field) \\
\mathbb{L} \vdash sync e' e
\end{array} (Sync)$$

$$\mathbb{L}' \vdash e$$

Now we need only define \vdash_{gb} (the hard bit).

Introduction to Paths Restricting Assignment Ramifications

글 🕨 🔸 글 🕨

A first attempt at defining \vdash_{gb}

Paths are sequences of field accesses starting from a variable e.g.

- x.f.g
- this.first.next.next

We use them to statically characterise objects.

Introduction to Paths Restricting Assignment Ramifications

A first attempt at defining \vdash_{gb}

Paths are sequences of field accesses starting from a variable e.g.

▶ x.f.g

this.first.next.next

We use them to statically characterise objects.

```
If we let \vdash_{gb} p : p
(i.e. the set of all locks = the set of all paths)
```

Introduction to Paths Restricting Assignment Ramifications

A first attempt at defining \vdash_{gb}

Paths are sequences of field accesses starting from a variable e.g.

▶ x.f.g

this.first.next.next

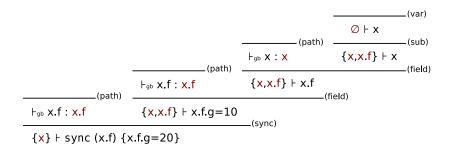

We use them to statically characterise objects.

If we let $\vdash_{gb} p : p$ (i.e. the set of all locks = the set of all paths)

Then we allow: sync (p) $\{ \dots p.f=20 \}$

Introduction to Paths Restricting Assignment Ramifications

A problem

$$\begin{split} \emptyset \vdash \text{sync (x)} &\{ \text{ x=y ; x.f=20 } \} \\ &\uparrow \text{ accesses the object y} \\ \text{similarly...} \\ &\{x\} \vdash \text{sync (x.f)} &\{ \text{ x.f=y ; x.f.g=20 } \} \\ &\uparrow \text{ accesses the object y} \end{split}$$

Solution – restrict such assignments.

How does this affect expressiveness?

æ

・ロン ・四と ・日と ・日と

Introduction to Paths Restricting Assignment Ramifications

Iteration

```
class Node { Node next; int cargo }
```

```
Node i = ...;
sync(i) {
    while (i!=null) {
        i.cargo = 20;
        i = i.next;
    }
}
```

æ

・ロト ・回ト ・ヨト ・ヨト

Introduction to Paths Restricting Assignment Ramifications

Iteration

```
class Node { Node next; int cargo }
```

```
Node i = ...;
sync(i) {
    while (i!=null) {
        i.cargo = 20;
        i = i.next;
    }
}
```

Here, assigning to i conflicts with the locking of i

æ

<ロ> (日) (日) (日) (日) (日)

Introduction to Paths Restricting Assignment Ramifications

What does this tell us?

This demonstrates that:

- ▶ 1:1 locking $(\vdash_{gb} p : p)$ is unfeasable.
- E.g. many nodes should be guarded by 1 lock.
- This allows granularity control, and iteration.
- (\vdash_{gb}) is now a many-to-1 relationship:

```
⊢<sub>gb</sub> i:l
⊢<sub>gb</sub> i.next:l
⊢<sub>gb</sub> i.next.next:l
```

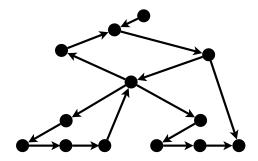

Need to be careful with assignment.

Carving the Heap Regions Regions as Locks

Summary

Carving up the heap helps us verify safe locking:

æ

Carving the Heap Regions Regions as Locks

Summary

Carving up the heap helps us verify safe locking:

► x.f = y ; x.f.g = 10
(must lock l where
$$\Gamma \vdash_{gb} y : l$$

Regions restrict assignment only where the lock changes.

• x.f = y ensures
$$\Gamma \vdash_{gb} x.f$$
 : 1

イロト イヨト イヨト イヨト

Carving the Heap Regions Regions as Locks

Summary 2

Advantages of carving with regions:

- Simple
- Inference is easy

Disadvantages of regions:

Lock count does not scale with object count

Regions used by:

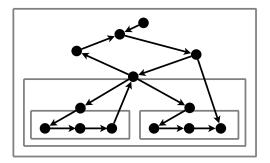

- Guava D. Bacon, R. Strom, A. Tarafdar (OOPSLA'00)
- Sync... with data M. Vaziri, F. Tip, J. Dolby (POPL'06)
- Locksmith P. Pratikakis, J. Foster, M. Hicks (PLDI'06)

                                              this
     x = y;
     x = z; // not allowed
     any Object a = z;
     z = a; // not allowed
     return y;
rep Object o = new rep C().m(new rep Object());
```

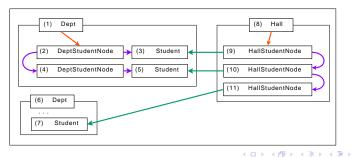

イロン イ部ン イヨン イヨン 三日

Carving the Heap Again Universes Synchronisation Conclusion

Background of Universes

Universes

- are an ownership type system (see Peter Müller's thesis).
- have the any type (unique to universes).
- are simple.
- are used in the JML (verification) tools.

æ

Carving the Heap Again Universes Synchronisation Conclusion

Synchronisation

Let's assume have a sound universe type system $\Gamma \vdash e : u$ (where $u \in \{rep, peer, any\}$)

We can use this to define:
$$\frac{\Gamma \vdash e : u}{\Gamma \vdash_{gb} e : u}$$

- Autolocker B. McCloskey et al (POPL'06)

Carving the Heap Again Universes Synchronisation Conclusion

Summary

We have

- given a race-safety type system that uses a \vdash_{gb} judgement.
- Shown the weakness of a path-based $\vdash_{gb} p : p$
- put objects into boxes and restricted assignment
 - with a static set of regions, and
 - with dynamic set of universes that grows at runtime

in order to build a more powerful \vdash_{gb} .

▶ used the simple path-based ⊢_{gb} with the universes ⊢_{gb}, to allow locking of any.

- < ≣ →

Image: A math a math

Carving the Heap Again Universes Synchronisation Conclusion

Atomicity

A race-safe block of code is atomic if its sync. is two-phase:

```
// GOOD
atomic {
                                        // UGLY (but good, and useful too)
    sync (x) {
                                        atomic {
        sync (y) {
                                            sync (x) {
              . . .
                                                 sync(y) {
              . . .
                                                     sync (x) {
         }
    }
                                                          . . .
                                                     }
}
                                                     sync (y) {
                                                          . . .
// BAD
                                                     }
atomic {
                                                }
    sync (x) { ... }
                                            }
    sync (y) { ... }
                                        }
}
